

ABSTRACT OF THE DISCLOSURE

An image displaying device includes a display unit which displays a cursor and at least one button; an input unit for
5 moving the cursor and for selecting the button; and a controller for controlling the display unit and the input unit. The input unit is provided with an operating part operated by an operator, at least one position sensor which detects an operation state of the operating part, and at
10 least one actuator which applies a specific external force to the operating part. When a display screen of the display unit is switched, the controller drives the actuator to move the cursor to a default position set in the switched display screen. In that case, the moving rate of the cursor is set
15 lower than a moving rate of the cursor for pulling the cursor towards the center of the button.
